Programming Windows Services with Microsoft Visual Basic 2008

Get the practical reference to developing Windows services with Visual Basic 2008.

Addressing the leading trend of software as a service, this guide illustrates how developers with intermediate Visual Basic skills can design and implement Web services. It addresses a critical gap in the developer literature today, showing that services can be developed with Visual Basic 2008-and are not restricted to XML-based applications or Microsoft Visual C#. Software as a service is changing the dynamic between rich and thin clients. As device types multiply, users expect "always-on" connectivity to link them to the robust Web and corporate applications they use on the desktop.

iterations in which the sample application - pomodo - is variously built, refactored, debugged, sliced, diced, and otherwise explored from every conceivable angle with respect to Ruby on Rails and Adobe Flex. The book unfolds both the application and the Flex-on-Rails approach side-by-side.

Building a Data Warehouse

Building a Data Warehouse: With Examples in SQL Server describes how to build a data warehouse completely from scratch and shows practical examples on how to do it. Author Vincent Rainardi also describes some practical issues he has experienced that developers are likely to encounter in their first data warehousing project, along with solutions and advice. The RDBMS used in the examples is SQL Server; the version will not be an issue as long as the user has SQL Server 2005 or later. The book is organized as follows. In the beginning of this book (Chapters 1 through 6), you learn how to build a data warehouse, for example, defining the architecture, understanding the methodology, gathering the requirements, designing the data models, and creating the databases.
